

Life course trajectories of family care: Implications for care policy

Eales, Jacquie and Fast, Janet "Life course trajectories of family care: Implications for care policy"
CRDCN research-policy snapshots. January 2022 <http://hdl.handle.net/11375/27305>

What the researchers did

Researchers drew a sample of 3,299 Canadians aged 65+ who had ever provided care from the 2012 General Social Survey on Caregiving and Care Receiving (representing 2.1 million Canadians). Using Latent Profile Analysis and cross-tabulations on retrospective care history data, they empirically identified life course patterns (trajectories) of family care.

What the researchers found

Researchers moved beyond point-in-time 'snapshots' of care to identify, for the first time, life course care trajectories. Trajectories differed in age of first care experience, number of care episodes, total years of care and amount of overlap among episodes. They identified five distinct trajectories: (1) late bloomer; (2) encore; (3) all at once; (4) enduring; and (5) serial. These are described in further detail in the attached supplementary information with percentage of the population experiencing that trajectory.

RDC Datasets used

2012 (Cycle 26) General Social Survey on Caregiving and Care Receiving (GSS)

Policy areas this research can inform

- Families, households and marital status
- Health
- Population and demography
- Seniors and aging
- Society and community

Policy implications of this research

Canada lacks a policy strategy to mitigate negative health, social and economic consequences for 8 million current and 13 million previous caregivers, despite claims that supporting them is important. Evidence about life course trajectories deepens understanding of caregiver diversity, and suggests interventions to mitigate cumulative financial, social, and health risks by tailoring solutions to the needs of caregivers with specific care trajectories (see supplementary information for details).
